In a release paper obtd. by forming a layer of release agent on at least one side of a base paper via an undercoat layer, the major component of the undercoat layer is a water-soluble copolymer consisting of (A)-(C) and has a Tg of -60 to 20 deg.C. (A) is hydrophilic ethylenically unsatd. monomer 5 to 50 wt%; (B) is alkyl (meth)acrylate 20 to 95 wt%; and (C) is another copolymerisable monomer 0 to 40 wt%. The water-soluble copolymer is applied to the surface of the base paper in amt., e.g., 1 to 10 g/m<sup>2</sup> based on dry wt.

Pref. (A) is a monomer contg. ethylenically unsatd. carboxylic acid such as (meth)acrylic acid or maleic acid; (B) is pref. a (meth)acrylate monomer having 4-10C alkyl such as butyl (meth)acrylate or hexyl (meth)acrylate; (C) is e.g., vinyl acetate, styrene, (meth)acrylonitrile, etc.

ADVANTAGE - The release paper has excellent threading and copying properties.
